

Polished Architectural Series

The corporate office of Cemstone Companies recently received a facelift. The project started in mid 2020 and the finishing touches are continuing into 2021. The 1st and 2nd floors were renovated to create expanded office areas, updated conference rooms with telecommunications technology, and an expanded cafeteria area. Outdoor work included updates to the landscaping and main entrance to give the building a more modern look and improved functionality.

Polished Architectural Series played a key role in updating the look and feel of the common areas. Polished precast benches and stairs were created utilizing Amcon's new state-of-the-art burnishing technology.

Outside the elevator area, Polished Architectural Veneer was added to enhance the aesthetics. The installers used Tenon Stone Veneer Joint Grout by TCC Materials to grout the joints.

Above, bottom left & middle: Precast steps and benches custom created and polished by Amcon.

Custom precast products reduce on-site labor and improve consistency while adding unlimited aesthetic options.

Bottom right: Polished Architectural Veneer units, along with 4" Splitface banding provide additional aesthetics to elevator areas.
